

Miral Amin

aminmiral0007@gmail.com | github.com/aminmiral | +91 99247 48030 | Ahmedabad, India

EDUCATION

L.J. University

B.Tech in Computer Engineering

- **CGPA:** 7.8

Jan 2022 – Jan 2026

Gujarat, India

EXPERIENCE

Odoo Backend Developer

RDFlex

Jul 2025 – Present

Gandhinagar, India

- Develop and customize Odoo ERP modules (Inventory, Sales, Purchase, Manufacturing) in Python — extending core models through the Odoo ORM with computed fields, onchange logic, and business-rule validations.
- Build server-side automation across interconnected modules: scheduled actions (cron jobs), approval workflows, and email/notification triggers driven by record state changes.
- Optimize slow ORM/SQL queries on production PostgreSQL; develop QWeb PDF reports and integrate external services via REST/XML-RPC APIs.
- Debug and patch production issues across multiple client environments; support module upgrades and data migrations between Odoo versions.

Odoo Developer Intern

RDFlex

Jan 2025 – Jun 2025

Gandhinagar, India

- Developed Python features for client-specific Odoo implementations under mentorship — custom models, views, wizards, and data-import scripts for onboarding client records.
- Participated in the full sprint cycle — code reviews, debugging, sprint planning — and supported module deployment and functional testing before client delivery.

PROJECTS

ERP Anomaly Bench | *Python, Odoo, Process Mining, scikit-learn*

GitHub

- Built a labeled event-log benchmark for ERP fraud detection by driving a real Odoo instance (Docker + custom audit addon) through simulated procure-to-pay flows with 7 injected fraud typologies (duplicate invoices, three-way-match violations, split purchases, subtle overbilling), yielding ground-truth labels at trace and event level.
- Benchmarked 6 unsupervised detectors (Isolation Forest, LOF, OC-SVM, Markov NLL, audit rules) under leakage-safe temporal splits — document-level fraud proved fully catchable (AUPRC 1.0) while cross-trace split purchases defeat all classical baselines (AUPRC 0.099).

SignSpeak — Indian Sign Language Translator | *Python, OpenCV, MediaPipe, scikit-learn*

GitHub

- Building a real-time two-way ISL communication tool: webcam signs recognized via MediaPipe hand landmarks become speech through tiered TTS (Indian-voice neural online, offline fallback), with Vosk speech-to-text for the hearing side's replies.
- Designed a privacy-first landmark-only data pipeline (no video stored) and a dynamic word-sign tier (MediaPipe Holistic + LSTM over 30-frame sequences with mirror/temporal-dropout augmentation); inference benchmarked at 8.6 ms p50 on CPU.
- Engineered to production standard: isolated camera/ML boundaries, 62-test headless suite, GitHub Actions CI, and an evaluation protocol reporting per-sign F1 and cross-signer (leave-one-signer-out) accuracy.

WhatsApp Chat Analyzer | *Python, Pandas, NLP*

- Built an analytics tool for exported WhatsApp chats — robust parser for the messy export format (multi-line messages, media placeholders, mixed Hindi/English), activity heatmaps, emoji/word-frequency and sentiment trends in a fully local Streamlit dashboard.

TECHNICAL SKILLS

Languages: Python, Java, JavaScript

ML & Computer Vision: scikit-learn, OpenCV, MediaPipe, Pandas, NumPy

Frameworks: Odoo (ERP), Django

Databases: PostgreSQL, MongoDB

Tools: Git, GitHub Actions (CI), Docker, pytest, Linux

Concepts: Data Structures, Process Mining, Anomaly Detection, HTML/CSS
